

Siddharth Kote

PCB Design Engineer • Electronics Hardware

+91-8623001138 | ✉ siddharthkote129@gmail.com | [GitHub](#) | Pune, India

Summary

Electronics and Communication Engineering graduate (2026) focused on **PCB design using KiCad**. Completed two end-to-end board designs, from **schematic capture and footprint assignment to 2-layer PCB layout, routing, DRC and Gerber generation**. Comfortable with microcontroller-based circuits and I2C, UART and ICSP interfaces. Seeking an entry-level **PCB Design Engineer / Hardware Engineer** role.

Education

Nutan College of Engineering and Research
B.Tech in Electronics and Communication Engineering

Pune, India
2022 – 2026

Skills

Schematic Design: KiCad Schematic Capture, Hierarchical Sheets, Symbol Creation, Component Selection, Net Labels, Power Flags, ERC

Layout Design: Footprint Assignment and Creation, Component Placement, Routing, Net Classes, Trace Width and Clearance, Vias, Copper Fills, DRC, Gerber and Drill Generation, 3D View

Electronics: Ohm's Law, Resistors, Capacitors, Crystals, LEDs, Voltage Regulators, Pull-up Resistors, Decoupling, Power Supply Circuits

Microcontrollers & Interfaces: ATmega328P, ESP32, I2C, UART, SPI/ICSP, GPIO, RTC, EEPROM, GPS and 4G LTE Modules

Tools: KiCad 9, Git, GitHub

Projects

MCU Data Logger – ATmega328P Data Acquisition Board | *KiCad, ATmega328P-AU, DS1337 RTC, 24LC1025 EEPROM* [GitHub](#)

Built in KiCad: a battery-backed data logger board with an ATmega328P-AU, DS1337 RTC and two 24LC1025 I2C EEPROMs (256 KB), with I2C, UART, GPIO and ICSP headers.

Schematic: hierarchical design (MCU, RTC, EEPROM and connector sheets) with crystals, I2C pull-ups, reset circuit, LEDs and decoupling; assigned footprints and verified with ERC.

PCB layout: 2-layer board with component placement, routing, copper fills and silkscreen; placed decoupling capacitors and the crystal close to their ICs; ran DRC and generated Gerbers.

SafeSteps – ESP32-Based Personal Safety Device | *KiCad, ESP32, NEO-6M GPS, A7670C 4G LTE* [GitHub](#)

Built in KiCad: the hardware for a personal safety device using an ESP32, NEO-6M GPS, A7670C 4G LTE module, SOS button, LED and buzzer, powered by a Li-Po battery and HT7333 3.3 V regulator.

Schematic: UART connections from the ESP32 to the GPS and LTE modules, GPIO and power sections; created custom symbols and footprints and verified with ERC.

PCB layout: configured net classes and design rules, placed components, routed power and signal traces, ran DRC and generated Gerbers.

Certifications

PCB Design with KiCad – Updated for KiCad 9 – Udemy

PCB Design Course – Simplilearn
